### **Elliptilight™ Intelligent Fluorescent Fixture**

The Elliptilight fixture is a wood housing with a highly polished aluminum elliptical 'forward throw' reflector that has four high wattage compact fluorescent lamps. There is a SwitchGenie primary switch in the fixture to produce 4 levels of light. There is only one power plug. There is a low voltage telephone cable that runs to the other fixtures to be connected on the same circuit and to the control panel that is to control all of the these fixtures. RF controls can be used where running a wire is not possible. The fixture can be hidden behind beams or painted to match the ceiling if it cannot be hidden.

The light from the ELLIPTILIGHT fixtures is a "FILL" light that is used to light the altar area in the front of the sanctuary. The front of the sanctuary should be a minimum of twice as bright as the lighting over the seating area. It can be 3 to 4 times as bright to capture the attention of those in the congregation. We recommend enough fixtures to cover the area completely depending on the size of the church.
